Code:

```
#include<iostream>

using namespace std;

class Human
{
private:
    string name;
    int age;
    char sex;

protected:
    Human();
public:
    void setter(string n, int numb, char gen)
    {
        name = n; age = numb; sex = gen;
    }
    int getAge()
    {
        return age;
    }
    string getName()
    {
        return name;
    }
    char getChar()
    {
        return sex;
    }
};

class Child :
    public Human {
private:
    string momName;
    string dadName;
    int allow=0;
public:
    Child(string name, int age, char sex, string momName, string dadName)
    {
        name = a;
    }
};

public:
    int getAllowance()
    { return allow; }
```

```
        public:
            void printParent()
            {}
// main function -
// where the execution of program begins
int main()
{

    return 0;
}
```
